

# EATING GLUTEN-FREE, COUNTING CARBS, AND STILL NOT FEELING GREAT?

Managing 2 diseases is very challenging. There are various ways to manage type 1 diabetes, but the only treatment for celiac disease is a gluten-free diet.

**What else can you do if you still have symptoms while following a gluten-free diet or have accidental exposure to gluten?**

If you are between 14-80 years old and diagnosed with both T1D and celiac disease, joining the **T1D+CeD Research Study** offers the opportunity to try a new investigational medication, designed to reduce symptoms of accidental glutening.

No biopsies or injections involved

8 visits over 34 weeks

Easy-to-drink medication
